Allosteric Adenosine Receptor Modulators

FIELD OF THE INVENTION

The present invention relates to certain thiophene derivatives and their use in the practice of medicine as allosteric modulators of adenosine receptors.

5

BACKGROUND OF THE INVENTION

This application is a continuation-in-part of U.S.S.N. 08/959,758, filed on October 29, 1997 by Pier G. Baraldi, entitled "Allosteric Adenosine Receptor Modulators."

10

Adenosine (Ado) is an autocoid (or local hormone) that modulates numerous functions in the cardiovascular and other organ systems. The actions of Ado are mediated by at least four subtypes of cell surface receptors called A_1 , A_{2a} , A_{2b} , and A_3 . Because of the ubiquity of adenosine receptors (AdoRs) throughout the human body, their indiscriminate activation may cause undesirable side effects. Therefore, it is desirable that drugs which are administered systemically to target these receptors have some degree of organ selectivity.

15

The overall function of Ado appears to be the regulation of the balance between oxygen (or energy) supply and consumption (or work). Ado increases oxygen supply by causing vasodilation and decreases oxygen consumption or work by inhibiting cellular functions, e.g., slowing of heart rate. Consistent with this protective function, A_1 AdoR agonists, Ado uptake blockers and Ado deaminase inhibitors have been shown to reduce cellular damage and dysfunction during hypoxia and ischemia. This protective role of Ado and A_1 AdoR agonists has been shown in heart, brain, liver, and intestines. This and other potentially beneficial actions of Ado have led to increased interest in the development of Ado-related drugs targeted to ameliorate conditions such as myocardial ischemia and stroke.

However, the widespread expression of Ado receptors and the lack of sufficiently selective adenosine agonists have been a major impediment to the successful development of direct-acting AdoR agonists to exploit the cytoprotective properties of Ado.

5

A number of compounds known to modulate the action of neurotransmitters, hormones and peptides bind at sites distinct from, but functionally linked to, the primary recognition site of the respective receptors. This form of interaction between two different ligands at the same receptor protein, which may result in modulation in the form of enhancement or inhibition of each other's binding and function, is referred to as allosterism. Positive (enhancement) or negative (inhibition) allosterism are important mechanisms of action of various biologically active agents. Numerous allosteric interactions have been exploited. Among the most well known of these are the allosteric interactions between the GABA receptor and benzodiazepines; the atrial natriuretic factor (ANF) receptor and amiloride; the dextromethorphan binding site and ropizine; and the muscarinic receptor and gallamine. Allosteric modulation of the actions of Ado on the A₁AdoR by several 2-amino-3-benzoylthiophenes on cultured cells, cardiac and brain preparations have been reported. The specificity of these compounds for A₁AdoRs have also been demonstrated .

10

It would be advantageous to provide allosteric modulators of Ado as an alternative to direct-acting Ado agonists and nucleoside uptake blockers, preferably those which can selectively modulate the response to Ado in only those organs or localized areas of a given organ in which production of Ado is increased.

15

It is therefore an object of the present invention to provide allosteric modulators of Ado function.

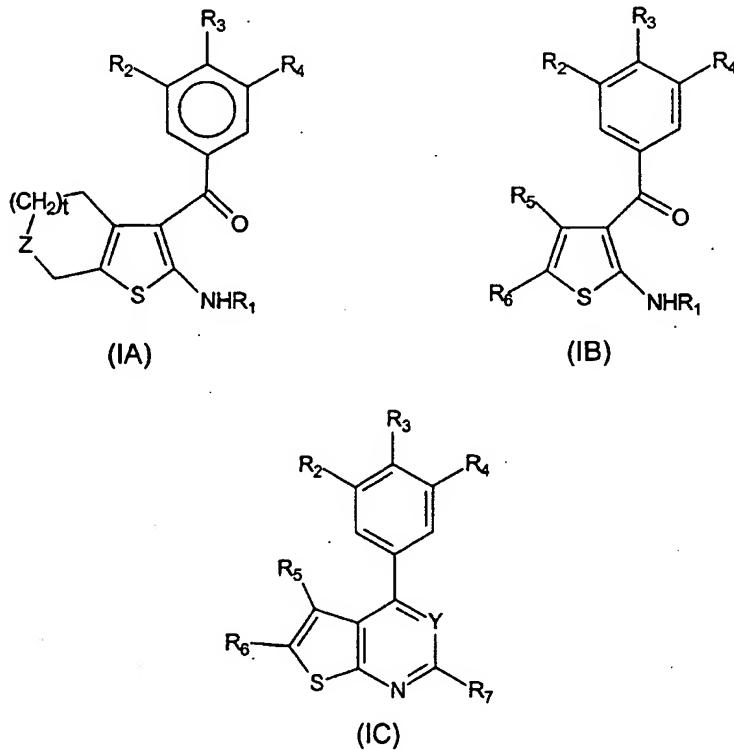

It is a further object of the present invention to provide allosteric modulators of Ado function which provide a more selective therapeutic effect than direct-acting AdoR agonists.

5 It is still a further object of the present invention to provide methods of administering allosteric modulators of Ado function which limit the times and locations at which significant release of Ado occurs so that systemic side effects are minimized.

Preparation of the Compounds

Those skilled in the art of organic chemistry will appreciate that reactive and fragile functional groups often must be protected prior to a particular reaction, or sequence of reactions, and then restored to their original forms after the last reaction is completed. 15 Usually groups are protected by converting them to a relatively stable derivative. For example, a hydroxyl group may be converted to an ether group and an amine group converted to an amide or carbamate. Methods of protecting and de-protecting, also known as "blocking" and "de-blocking," are well known and widely practiced in the art, e.g., see T. Green, *Protective Groups in Organic Synthesis*, John Wiley, New York (1981) or

Protective Groups in Organic Chemistry, Ed. J.F.W. McOmie, Plenum Press, London (1973).

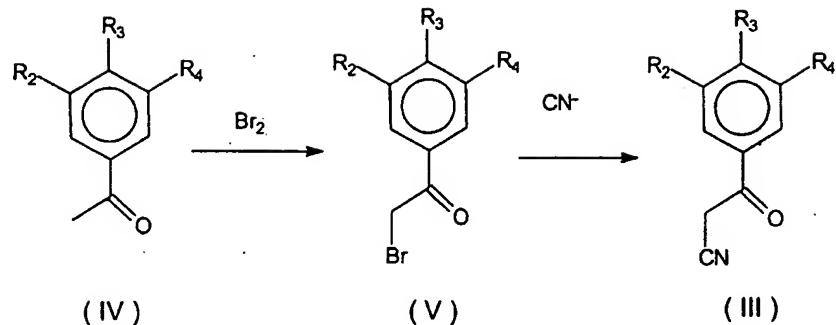

SCHEME 1

Compounds of formula **1B** may be conveniently prepared according to Scheme 1.

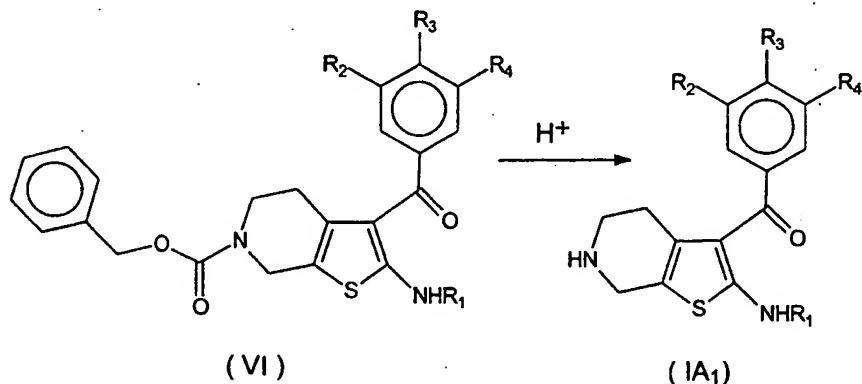

5 In Step 1 a compound of formula (II) is reacted with a compound of formula (III) in the presence of morpholine and molecular sulfur in a protic solvent, such as ethanol, at about 50° to about 65° C for about an hour to yield a compound of formula IA wherein R1 is hydrogen.

10 Compounds of formula (IA) wherein R₁ is other than hydrogen may be prepared according to Step 2 by reacting a compound of formula (IB) from Step 1, wherein R₁ is hydrogen, with R₁X (wherein R₁ is other than hydrogen, and X is a leaving group). For a discussion of nucleophilic displacement reactions and leaving groups, see standard organic chemistry texts such as J. March, *Advanced Organic Chemistry*, Chapter 10, John Wiley & Sons, New York (1985). Compounds of formula (II) are commercially available or may be prepared by methods known to those of skill in the art. Compound of formula (III), benzophenone derivatives, may be prepared by methods known to those of skill in the art or conveniently according to Scheme 2.

SCHEME 2

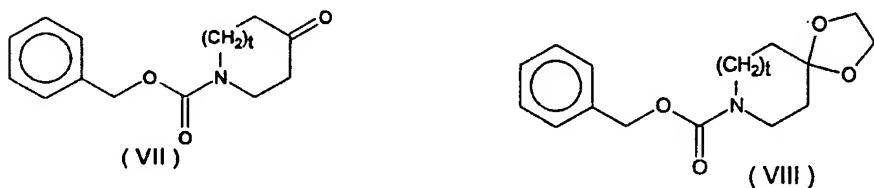

In Scheme 2, a compound of formula (IV), a substituted acetophenone, is alpha brominated with molecular bromine in a protic, polar solvent, such as acetic acid to yield the corresponding alpha bromo compound of formula (V). The compound of formula (III) is produced by reacting the compound of formula (V) with a source of cyanide ions, such as sodium or potassium cyanide, in a polar solvent, such as water, ethanol, or a mixture thereof.

SCHEME 3

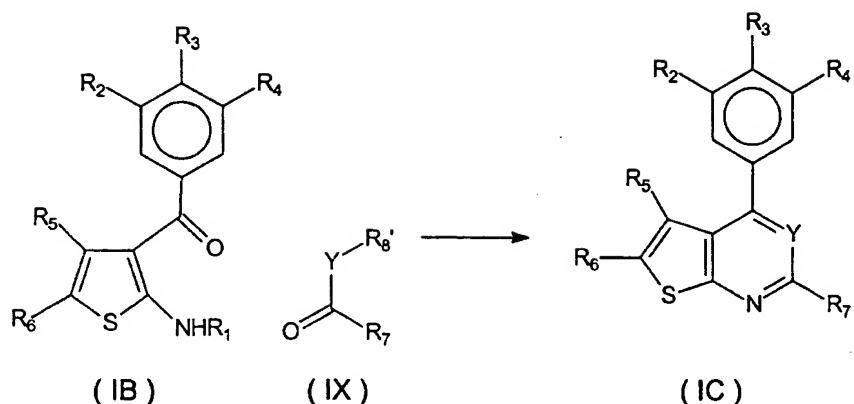

As shown in Scheme 3, a compound of formula (IA₁) wherein Z is NH may be prepared by hydrolyzing the CO-N urethane linkage of a compound of formula (VI) under acidic conditions, e.g., hydrogen bromide in acetic acid.

5 In turn, a compound of formula (VI) may be prepared in a similar manner as the reaction of Scheme 1 by substituting a compound of formula (II) with a corresponding amount of a compound of formula (VII). It may be necessary to protect the carbonyl group

of the piperidinone moiety during the synthesis of a precursor compound, *e.g.*, by converting it to an ethylenedioxy derivative as seen in formula (VIII). The protecting or blocking group is removed after the synthesis of a compound of formula (VIII) to generate a compound of formula (VII).

Compounds of formula (IA) wherein Z is a substituted nitrogen, *i.e.*, N-(Gr)_m(Am)_n(Alk)_p(Ar)_q, may be prepared by nucleophilic displacement by reacting a compound of the formula X-(Gr)_m(Am)_n(Alk)_p(Ar)_q, wherein X is a leaving group (see *March, supra*), in a polar solvent in the presence of a weak base such as sodium or potassium carbonate or a tertiary amine.

SCHEME 4

According to Scheme 4, a compounds of formula (IC), can be prepared from the corresponding compound of formula (IB), wherein R₁ is hydrogen, by reacting with a compound of formula (IX) in a protic, polar solvent, such as ethanol, in the presence of a strong base such as sodium ethoxide to form the pyridine moiety. (If Y is nitrogen, then R₈' is H₂, and if Y is CH, then R₈' is -C(O)OR₈). This reaction can conveniently be carried out by mixing the reactants, solvent and base at about 0°C followed by heating at reflux for about 10 hours. A compound of formula (IC) wherein Y is nitrogen, *i.e.*, R₈ is H₂, can be prepared from the corresponding compound of formula (IB) by reaction with a compound of formula R₇-C(O)NH₂, *e.g.*, formamide, if R₇ is hydrogen, at about 180° C for about 5 hours.

Compounds of formula (IA) wherein Z is N-(Gr)_m(Am)_n(Alk)_p(Ar)_q, and Am is an amino acid or an amino acid with the amino group protected, and m, p, and q are 0, may be prepared by reacting the corresponding compound wherein Z is NH with a protected derivative of an amino acid. An example of a protected amino acid is BOC-tyrosine (“BOC-Tyr-OH”) wherein “BOC” is -C(O)OC(CH₃)₃. Preferably the reaction is run in a polar, aprotic solvent, such as dimethylformamide. Preparation of BOC derivatives of amino acids are well known in the art of protein and peptide chemistry. If desired the BOC

moiety may be removed by standard means known in the art to restore the amino acid residue.

5 Compounds which include quaternary ammonium salts, for example, at the 6-position, can be prepared by reacting the amine at the desired position with excess alkyl halides using routine alkylation conditions. Compounds with urea linkages can be prepared by reacting the amine at the 6-position with the desired isocyanate. Urethanes can be prepared by reacting the amine at the 6-position with the desired alkyl chlorocarbonate (as shown, for example, in Morrison & Boyd, Organic Chemistry, Fourth Edition, Allyn & 10 Bacon, Inc., Boston, 1983, page 840).

20 The compounds can be administered via any medically acceptable means. Suitable means of administration include oral, rectal, topical or parenteral (including subcutaneous, intramuscular and intravenous) administration, although oral or parenteral administration are preferred.

25 The amount of the compound required to be effective as an allosteric modulator of an adenosine receptor will, of course, vary with the individual mammal being treated and is ultimately at the discretion of the medical or veterinary practitioner. The factors to be considered include the condition being treated, the route of administration, the nature of the formulation, the mammal's body weight, surface area, age and general condition, and the particular compound to be administered. However, a suitable effective dose is in the range

of about 0.1 μ g/kg to about 10 mg/kg body weight per day, preferably in the range of about 1 mg/kg to about 3 mg/kg per day.

5 The total daily dose may be given as a single dose, multiple doses, *e.g.*, two to six times per day, or by intravenous infusion for a selected duration. Dosages above or below the range cited above are within the scope of the present invention and may be administered to the individual patient if desired and necessary. For example, for a 75 kg mammal, a dose range would be about 75 mg to about 220 mg per day, and a typical dose would be about 150 mg per day. If discrete multiple doses are indicated, treatment might 10 typically be 50 mg of a compound given 3 times per day.

Formulations

15 The compounds described above are preferably administered in formulation including an active compound, *i.e.*, a compound of formula (IA), (IB) or (IC), together with an acceptable carrier for the mode of administration. Suitable pharmaceutically acceptable carriers are known to those of skill in the art. The compositions can optionally include other therapeutically active ingredients, such as antibiotics, antivirals, healing promotion agents, anti-inflammatory agents, immunosuppressants, growth factors, anti-metabolites, cell adhesion molecules (CAMs), cytotoxic agents, antibodies, vascularizing agents, anti-coagulants, and anesthetics/analgesics. The carrier must be pharmaceutically acceptable in 20 the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

25 The formulations can include carriers suitable for oral, rectal, topical or parenteral (including subcutaneous, intramuscular and intravenous) administration. Preferred carriers are those suitable for oral or parenteral administration.

30 Formulations suitable for parenteral administration conveniently include sterile aqueous preparation of the active compound which is preferably isotonic with the blood of the recipient. Thus, such formulations may conveniently contain distilled water, 5%

dextrose in distilled water or saline. Useful formulations also include concentrated solutions or solids containing the compound of formula (I) which upon dilution with an appropriate solvent give a solution suitable for parental administration above.

5 For enteral administration, the compound can be incorporated into an inert carrier in discrete units such as capsules, cachets, tablets or lozenges, each containing a predetermined amount of the active compound; as a powder or granules; or a suspension or solution in an aqueous liquid or non-aqueous liquid, e.g., a syrup, an elixir, an emulsion or a draught. Suitable carriers may be starches or sugars and include lubricants, flavorings, 10 binders, and other materials of the same nature.

15 A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active compound in a free-flowing form, e.g., a powder or granules, optionally mixed with accessory ingredients, e.g., binders, lubricants, inert diluents, surface active or dispersing agents. Molded tablets may be made by molding in a suitable machine, a mixture of the powdered active compound with any suitable carrier.

20 A syrup or suspension may be made by adding the active compound to a concentrated, aqueous solution of a sugar, e.g., sucrose, to which may also be added any accessory ingredients. Such accessory ingredients may include flavoring, an agent to retard crystallization of the sugar or an agent to increase the solubility of any other ingredient, e.g., as a polyhydric alcohol, for example, glycerol or sorbitol.

25 The compounds can also be administered locally by topical application of a solution, ointment, cream, gel, lotion or polymeric material (for example, a PluronicTM, BASF), which may be prepared by conventional methods known in the art of pharmacy. In addition to the solution, ointment, cream, gel, lotion or polymeric base and the active ingredient, such topical formulations may also contain preservatives, perfumes, and 30 additional active pharmaceutical agents.

Formulations for rectal administration may be presented as a suppository with a conventional carrier, e.g., cocoa butter or Witepsol S55 (trademark of Dynamite Nobel Chemical, Germany), for a suppository base.

5 Alternatively, the compound may be administered in liposomes or microspheres (or microparticles). Methods for preparing liposomes and microspheres for administration to a patient are well known to those of skill in the art. U.S. Patent No. 4,789,734, the contents of which are hereby incorporated by reference, describes methods for encapsulating biological materials in liposomes. Essentially, the material is dissolved in an aqueous 10 solution, the appropriate phospholipids and lipids added, along with surfactants if required, and the material dialyzed or sonicated, as necessary. A review of known methods is provided by G. Gregoriadis, Chapter 14, "Liposomes," Drug Carriers in Biology and Medicine, pp. 287-341 (Academic Press, 1979). Microspheres formed of polymers or 15 proteins are well known to those skilled in the art, and can be tailored for passage through the gastrointestinal tract directly into the blood stream. Alternatively, the compound can be incorporated and the microspheres, or composite of microspheres, implanted for slow release over a period of time ranging from days to months. See, for example, U.S. Patent Nos. 4,906,474, 4,925,673 and 3,625,214, the contents of which are hereby incorporated by 20 reference.

25 Preferred microparticles are those prepared from biodegradable polymers, such as polyglycolide, polylactide and copolymers thereof. Those of skill in the art can readily determine an appropriate carrier system depending on various factors, including the desired rate of drug release and the desired dosage.

30 The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active compound into association with a carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing the active compound into association with a liquid carrier or a

finely divided solid carrier and then, if necessary, shaping the product into desired unit dosage form.

5 In addition to the aforementioned ingredients, the formulations may further include one or more optional accessory ingredient(s) utilized in the art of pharmaceutical formulations, e.g., diluents, buffers, flavoring agents, binders, surface active agents, thickeners, lubricants, suspending agents, preservatives (including antioxidants) and the like.

10 Determination of the Degree of Activity for the Compounds

The activity of the compounds can be readily determined using no more than routine experimentation using any of the following assays.

15 *Binding assays.*

15 The prototypical allosteric enhancer PD 81,723, (prepared in Example 4; see Bruns *et al.*, *Mole. Pharm.*, **38**:939 (1990), Cao *et al.*, *Gen Pharmac.* **26**:1545 (1995), and Amoah-Apraku *et al.*, *J. Pharm. Exper. Ther.* **266**(2):611(1993)) has both enhancing and inhibitory activity at the A₁AdoR. Therefore, the effect of a novel series of benzoylthiophene derivatives was determined on both the agonist [³H]CCPA and the antagonist [³H]CPX binding to membranes prepared from CHO cells stably expressing the human A₁ AdoR (CHO-huA₁ AdoR). The enhancing activity was estimated by the magnitude of the increase in [³H]CCPA binding whereas the inhibitory and (or antagonistic) activity was evaluated by the potency of the benzoylthiophene derivatives to compete for the specific binding of [³H]CPX. The method used for the preparation of the membranes of CHO cells expressing huA₁ AdoR, and the protocols for the radioligand binding assays are described by Kollias-Baker *et al.*, (*JPET*, **281**, 761(1997) and *Circ. Res.*, **75**, 961 (1994)).

Functional Assays.

In previous studies (Amoah-Apraku *et al.*, *J. Pharmacol Exp. Ther.*, **266**, 611 (1993) and Kollias-Baker, *supra*) the prototypical allosteric enhancer PD 81,723 was shown to selectively enhance A₁ AdoR-mediated prolongation of the stimulus to His (S-H) 5 bundle interval (negative dromotropic effect) but did not increase the A_{2a}AdoR-mediated coronary vasodilation caused by Ado. Therefore, the effect of compound 20 on the negative dromotropic action of Ado in guinea pig isolated perfused hearts was determined. The guinea pig isolated perfused heart preparation and the methods for recording His bundle electrograms and measuring the S-H intervals have been previously reported.

10

*Results**Radioligand Binding Assays*

The effect of the benzoylthiophene derivative compound 20 on agonist and antagonist binding to CHO cells expressing the recombinant huA₁AdoR was investigated. 15 Specifically, the effects of compound 20 on the binding of the agonist radioligand [³H]CCPA (2 nM) and the antagonist radioligand [³H]CPX (1 nM) to recombinant CHO-huA₁AdoR were determined. As shown in Figure 1A, the effect of compound 20 on the specific binding of [³H]CCPA was biphasic, at concentrations up to 7 μ M it increased but thereafter it decreased the specific binding of [³H]CCPA. In contrast, compound 20 did not 20 enhance the binding of the antagonist radioligand [³H]CPX and at concentrations greater than 1 μ M decreased the specific binding of [³H]CPX, see Figure 1B. The values are mean \pm SEM of 4 hearts. Each data point represents mean \pm SEM specific binding with determinations from 2-3 experiments. Figures 2A-D and 3A-D are similar to Figure 1A but show the result of [³H]CCPA studies on other compounds.

25

Functional Studies

Consistent with the results of the radioligand binding assays, compound 20 enhanced the negative dromotropic effect (S-H interval prolongation) caused by Ado in a concentration-dependent manner (Figure 4A). In pressure of 1 μ M Compound 20, 3 μ M 30 adenosine caused 2° A-V block in 2 of 4 hearts. The values are mean \pm SEM of 4 guinea

pigs. For instance, 0.1, 0.5 and 1.0 μ M compound 20 enhanced the S-H prolongation induced by 3 μ M Ado by 32%, 77%, and 31 1 %, respectively. At 1.0 μ M compound 20, the negative dromotropic effect of Ado was maximal, eliciting 2° A-V block in 2 of 4 hearts. In contrast, in the absence of compound 20, the same concentration of Ado (3 μ M) prolonged the S-H interval by 11 \pm 3 msec. To demonstrate that the enhancement of the dromotropic effect of Ado by compound 20 was mediated by activation of A₁AdoRs, prolongation of S-H interval caused by Ado in the presence of compound 20 was shown to be reversed by 10 μ M of the A₁AdoR antagonist CPX (Figure 4B). The reversal of the effects of compound 20 by CPX establishes that the enhancement was mediated through the A₁AdoR.

Example 48: Evaluation of Compounds

The compounds described in Examples 1-29 above were assayed for their allosteric enhancing ability at the adenosine A₁ receptor. These are listed as T1 through T29 below.

15

Materials and Methods

20

Compounds T1 through T29 were provided by Medco Research, Inc. The adenosine A₁ receptor agonist N⁶ cyclopentyladenosine (CPA) and the adenylyl cyclase activator forskolin were purchased from Research Biochemicals, Inc. Rolipram was a gift from Berlex Labs. Adenosine deaminase was purchased from Sigma Chemical. Ham's F-12 culture medium and fetal bovine serum were purchased from GIBCO Life Technologies. Cell culture plasticware and antibiotic G-418 were from Fisher Scientific.

25

The preparation chosen for the assay of the compounds was the Chinese hamster ovary (CHO) cell expressing human recombinant adenosine A₁ receptors at a density of around 8000 fmol/mg protein. These cells were cultured using known techniques (Shryock et al., Mol. Pharmacol., 1998, 53:886-893, the contents of which are hereby incorporated by reference).

Protocol

The effect of each compounds on cAMP content of cultured CHO cells was determined in the presence of forskolin (1-1.5 μ M), rolipram (20 μ M), the adenosine receptor agonist CPA (0.05-0.1 nM) and adenosine deaminase (2 U/mL). Forskoline was used to increase the activity of adenylyl cyclase and the content of cAMP in cells, and 5 rolipram was used to inhibit the activity of cAMP phosphodiesterases that degrade cAMP. Adenosine deaminase was used to degrade endogenous adenosine in the incubation medium.

10 To begin an experiment, CHO cells grown in individual wells of 12-well culture plates were washed once with Hank's buffered saline solution to remove growth medium. The Hank's solution was itself then removed and replaced with fresh Hank's solution at 36° C containing forskolin, rolipram, CPA, adenosine deaminase, and the compound to be assayed. After an incubation of six minute duration, this solution was removed and replaced with 50 mM hydrochloric acid to terminate the effect of the drug, lyse the cells, 15 and prevent further enzymatic formation and metabolism of cAMP. The cAM content of acid extracts of cells was determined by radioimmunoassay as previously described (Shryock et al., *Mol. Pharmacol.*, 1998, 53:886-893). In each experiment, 4-5 compounds were tested in parallel, at each of four concentrations, 0.01, 0.1, 1 and 10 μ M. As a control, the effect of CPA (0.1-10 nM) was determined in each experiment. Protein content of cell 20 samples was measured by the method of Bradford using a kit form Bio-Rad with albumin as a reference standard.

Results

25 The compounds acted to both enhance and antagonize the effect of the adenosine A₁ receptor agonist, CPA, on CHO cells expressing adenosine A₁ receptors. The effects of all twenty nine compounds are shown in Figures 5-10 (bar graphs) and Figures 11-16 (concentration response plots). Compounds T3, T5, T7, T9, T13, T19 and T21 decreased cAMP content in the presence of a low concentration of CPA (0.05-0.1 nM). These compounds are thus indicated by the CHO cell assay to be allosteric enhancers of the action

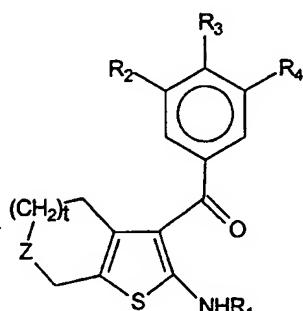

of an adenosine A₁ receptor agonist. Compounds T5, T7, T9, and T13 appear to be the best enhancers. Compound T7 had the highest potency and efficacy (maximal effect).

5 Several compounds (i.e., T11, T12, T23, T24, and T27) acted as antagonists of the action of CPA. Two compounds (T6 and T15) at a low concentration enhanced the action of CPA, but at a higher concentration antagonized the action of CPA.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-8 (in part), 9, 10, 12-21 (in part)

Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
